

Workshop – Prediction Analysis, Buckling

AN MSC NASTRAN MACHINE LEARNING WEB APP TUTORIAL

Goal: Prediction Analysis

This tutorial consists of multiple parts

1. Configuring The Problem Statement
 - In this tutorial, we configure the parameters and the responses to monitor.
2. Configuring Multiple Batch Runs
 - This section discusses how to configure and execute multiple MSC Nastran runs.
3. Performing Predictions
 - Gaussian process (GP) regression is used to train a surrogate model and perform predictions.
 - The prediction performance of the surrogate model is evaluated.
4. Creating Plots with the HDF5 Explorer
 - The HDF5 Explorer web app is used to create Eigenvalue vs. Mode Number plots.

Details of the Structural Model

1. Perform a buckling analysis for different values of K_s
2. Monitor the eigenvalue response for each value of K_s

Details of the Structural Model

Problem Statement

Design Variables

x1: K of PELAS 20

Note that K is displayed as K_s in the figure

$$.1 < x1 < 10.0$$

Samples

- Batch set 1 – 10 run LHS Design
- Batch set 2 – 20 run LHS Design

Monitored Responses

r0: Eigenvalue of Mode 1

Contact me

- Nastran SOL 200 training
- Nastran SOL 200 questions
- Structural or mechanical optimization questions
- Access to the SOL 200 Web App

christian@ the-engineering-lab.com

More Information Available in the Appendix

The Appendix includes information regarding the following:

- How to import and edit previous files
- What is Gaussian Process Regression?

Tutorial

Tutorial Overview

1. Start with a .bdf or .dat file
2. Use the Machine Learning web app to:
 1. Configure the problem statement
 2. Configure multiple batch runs
3. Use the Prediction Analysis web app to:
 1. Perform predictions
4. Use the HDF5 Explorer to:
 1. Create plots

Special Topics Covered

Training Data – The training data consists of the parameter inputs and respective output responses for multiple MSC Nastran runs. This tutorial describes how to configure multiple MSC Nastran runs, each with different parameter inputs, and how to monitor each response.

Gaussian process regression – This tutorial describes the procedure to use Gaussian process regression to train a surrogate model and make predictions.

Automatic Response Extraction – Often responses are manually or automatically extracted from the F06 file. This becomes challenging when extracting responses from multiple F06 files. This tutorial highlights the web app's ability to automatically extract responses from multiple H5 files with minimal user effort.

SOL 200 Web App Capabilities

The Post-processor Web App and HDF5 Explorer are free to MSC Nastran users.

Compatibility

- Google Chrome, Mozilla Firefox or Microsoft Edge
- Windows and Red Hat Linux
- Installable on a company laptop, workstation or server. All data remains within your company.

Web Apps

Benefits

- REAL TIME error detection. 200+ error validations.
- REAL TIME creation of bulk data entries.
- Web browser accessible
- Free Post-processor web apps
- +80 tutorials

Web Apps for MSC Nastran SOL 200
Pre/post for MSC Nastran SOL 200.
Support for size, topology, topometry, topography, multi-model optimization.

Machine Learning Web App
Bayesian Optimization for nonlinear response optimization (SOL 400)

PBMSECT Web App
Generate PBMSECT and PBRSECT entries graphically

Ply Shape Optimization Web App
Optimize composite ply drop-off locations, and generate new PCOMPG entries

Post-processor Web App
View MSC Nastran results in a web browser on Windows and Linux

Shape Optimization Web App
Use a web application to configure and perform shape optimization.

Remote Execution Web App
Run MSC Nastran jobs on remote Linux or Windows systems available on the local network

Dynamic Loads Web App
Generate RLOAD1, RLOAD2 and DLOAD entries graphically

Stacking Sequence Web App
Optimize the stacking sequence of composite laminate plies

HDF5 Explorer Web App
Create graphs (XY plots) using data from the H5 file

Configuring The Problem Statement

Before Starting

1. Ensure the Downloads directory is empty in order to prevent confusion with other files

- Throughout this workshop, you will be working with multiple file types and directories such as:
 - .bdf/.dat
 - nastran_working_directory
 - .f06, .log, .pch, .h5, etc.
- To minimize confusion with files and folders, it is encouraged to start with a clean directory.

Go to the User's Guide

1. Click on the indicated link

- The necessary BDF files for this tutorial are available in the Tutorials section of the User's Guide.

Obtain Starting Files

1. Find the indicated example
2. Click Link
3. The starting file has been downloaded

- When starting the procedure, all the necessary BDF, or DAT, files must be collected and uploaded together. Relevant INCLUDE files must also be collected and uploaded.

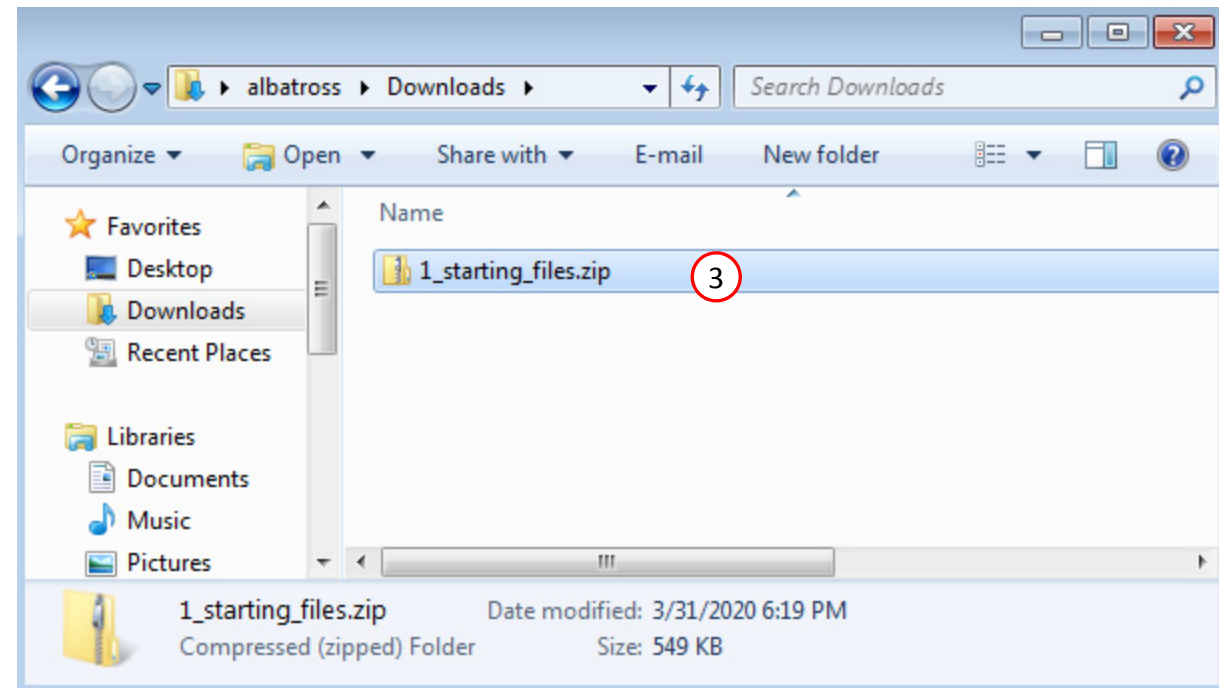

Prediction Analysis, Buckling ①

Consider a linear buckling analysis. The parameter allowed to vary is a spring constant. The response of interest is the buckling load factor.

This tutorial describes how to configure multiple MSC Nastran runs to generate training data. Gaussian process regression is used to train a surrogate model and make predictions. The prediction performance of the surrogate model is also evaluated.

Starting Files [Link](#)

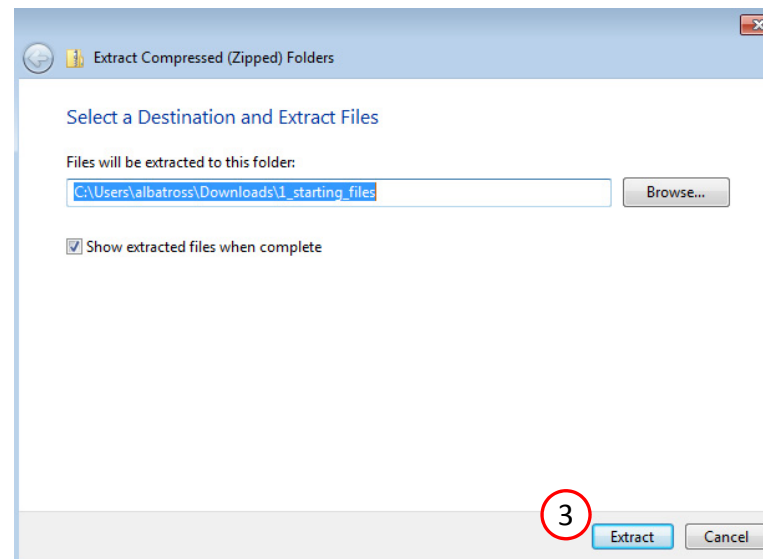

Solution BDF Files: [Link](#)

Obtain Starting Files

1. Right click on the zip file
2. Select Extract All...
3. Click Extract
4. The starting files are now available in a folder

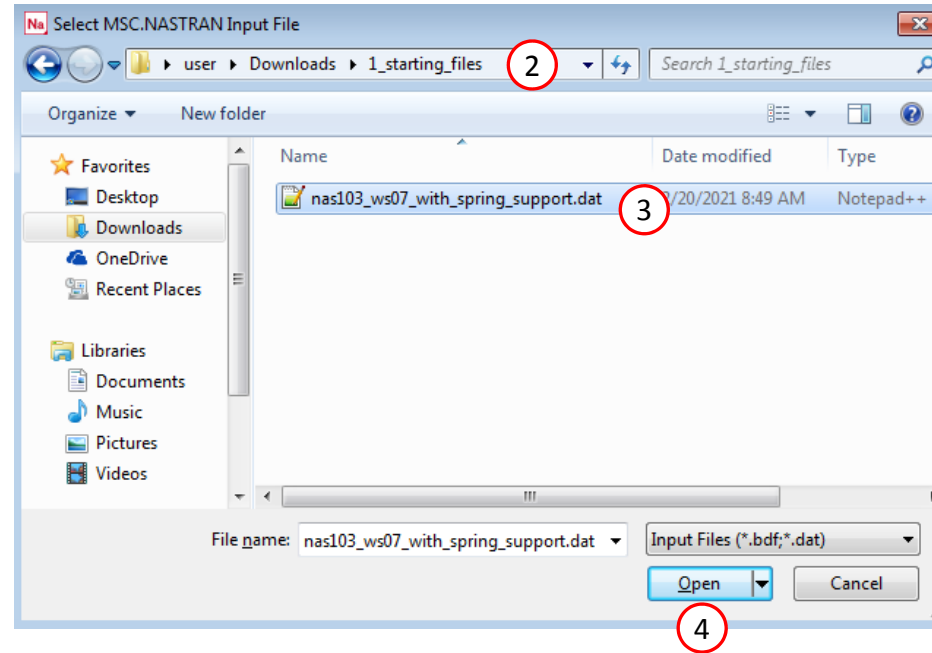

- The starting files for this tutorial are contained in a ZIP file and must be extracted as shown.

Create the Starting H5 File

A starting H5 file must be created. This H5 file will be used to configure the responses later on.

1. Double click the MSC Nastran desktop shortcut
2. Navigate to the directory named 1_starting_files
3. Select the indicated file
4. Click Open
5. Click Run
6. The starting H5 file is created

Use the same MSC Nastran version throughout this exercise

The following applies if you have multiple versions of MSC Nastran installed.

To ensure compatibility, use the same MSC Nastran version throughout this exercise. For example, scenario 1 is OK but scenario 2 is NOT OK.

- Scenario 1 - OK
 - MSC Nastran 2021 is used to create the starting H5 file.
 - MSC Nastran 2021 is used for each run during Machine Learning or Parameter study.
- Scenario 2 – NOT OK
 - MSC Nastran 2018.2 is used to create the starting H5 file.
 - MSC Nastran 2021 is used for each run during Machine Learning or Parameter study.

Using the same MSC Nastran version is critical for consistent response extraction from the H5 file. A response configured for Nastran version X may not match in Nastran version Y, which leads to unsuccessful response extraction from the H5 files. The goal is to make sure all H5 files generated are from the same MSC Nastran version.

Open the Correct Page

1. Click on the indicated link

- MSC Nastran can perform many optimization types. The SOL 200 Web App includes dedicated web apps for the following:
 - Optimization for SOL 200 (Size, Topology, Topometry, Topography, Local Optimization, Sensitivity Analysis and Global Optimization)
 - Multi Model Optimization
 - Machine Learning
- The web app also features the HDF5 Explorer, a web application to extract results from the H5 file type.

Select BDF Files

1. Select files nas103_ws07_with_spring_support.dat

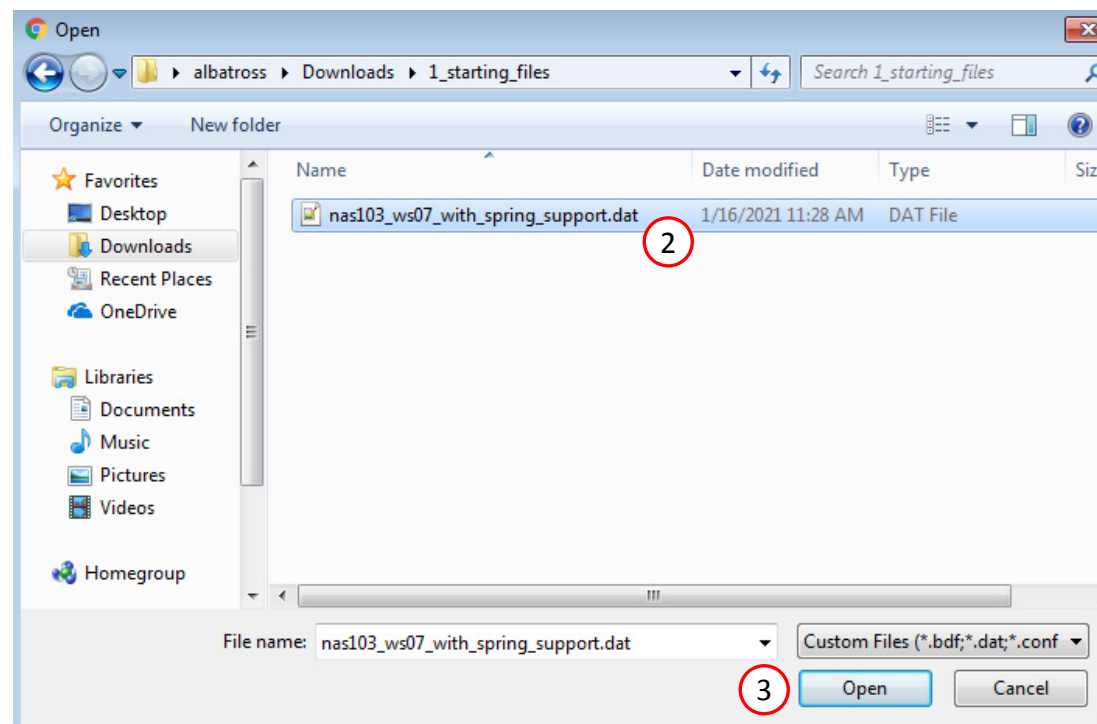

Inspecting: 100%

4. Upload files

Uploading: 100 %

Select BDF Files

1. Click Select files
2. Select the indicated files
3. Click Open
4. Click Upload files

Parameters

1. Set the following fields as parameters
 - x1: The spring stiffness of PELAS 20
2. Parameters have been created for the selected fields
3. For each parameter, use the following settings:
 - Low: .1
 - High: 10.

- Bulk data entries will always be displayed in the small field format.
- Only fields that have real or integer data entries may be selected as parameters. If the field is blank or contains only characters, the field may not be selected.

Select Parameters

\$ _1_ _2_ _3_ _4_ _5_ _6_ _7_						
EIGB	30	INV	0.	3.	20	2
FORCE	6	2		1.	0.	-1. 0.

Configuring Multiple Batch Runs

Samples

In the following slides, we will configure 2 batches to run.

Batch	File Name	Number of Runs	Purpose
1	nastran_working_directory.zip	10	The data from these 10 runs is used to train the surrogate model.
2	nastran_working_directory (1).zip	20	The data from these 20 runs is compared with the predictions from the surrogate model. The normalized root mean square error (NRMSE) is calculated based on these 20 runs.

Samples

1. Click Samples
2. Ensure the following design is selected:
Latin Hypercube, Reproducible
3. Set Number of Samples to 10
4. The samples have been updated, note that
samples 1, 2, 3, ..., 10 are visible
5. The indicated controls can be used to
display the other samples

7

Start Desktop App

1. Right click on the indicated file
2. Click Extract All
3. Click Extract on the following window
4. Repeat steps 1-3 for the indicated files

- Always extract the contents of the ZIP file to a new, empty folder.

Start Desktop App

1. Open this folder:
nastran_working_directory
2. Inside of the new folder, double click on
Start Desktop App
3. Click Open, Run or Allow Access on any
subsequent windows
4. MSC Nastran will now start

- One can run the Nastran job on a remote machine as follows:
1) Copy the BDF files and the INCLUDE files to a remote machine. 2) Run the MSC Nastran job on the remote machine. 3) After completion, copy the BDF, F06, LOG, H5 files to the local machine. 4) Click "Start Desktop App" to display the results.

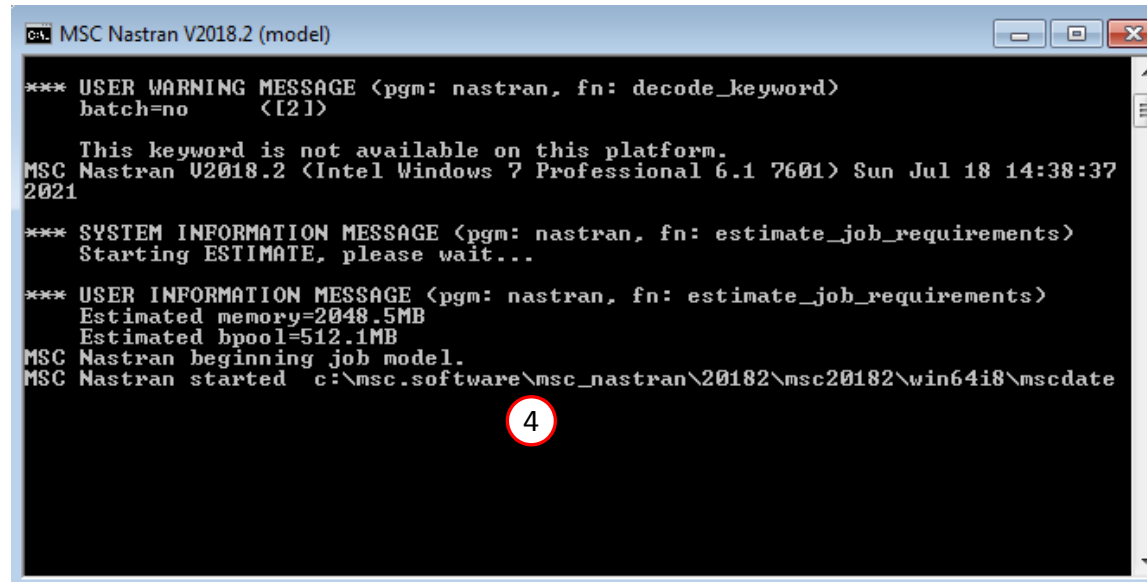

Using Linux?

Follow these instructions:

- 1) Open Terminal
- 2) Navigate to the nastran_working_directory
`cd ./nastran_working_directory`
- 3) Use this command to start the process
`./Start_MSC_Nastran.sh`

In some instances, execute permission must be granted to the directory. Use this command. This command assumes you are one folder level up.

```
sudo chmod -R u+x ./nastran_working_directory
```

Status

- While MSC Nastran is running, a status page will show the current state of MSC Nastran

SOL 200 Web App - Status

 Python

 MSC Nastran

Status

Name	Status of Job	Design Cycle	RUN TERMINATED DUE TO
model.bdf	Running	None	

Review Results

1. A window appears asking to start the HDF5 Explorer
2. Click Skip to not open the HDF5 Explorer

Review Results

- 1. The Monitored Responses web app is opened
- 2. The value of each response and for each sample is displayed in a bar chart
- 3. A table lists the values for each response and sample.

B

Monitored Responses

Display MAX and MIN Download CSV Reset Filters

Label	Dataset Name	Field	Field Description	Current Value
r1	SUMMARY/EIGENVALUE	EIGEN		
r1	SUMMARY/EIGENVALUE	EIGEN		10.001500337521877

3

Monitored Responses from Each Sample

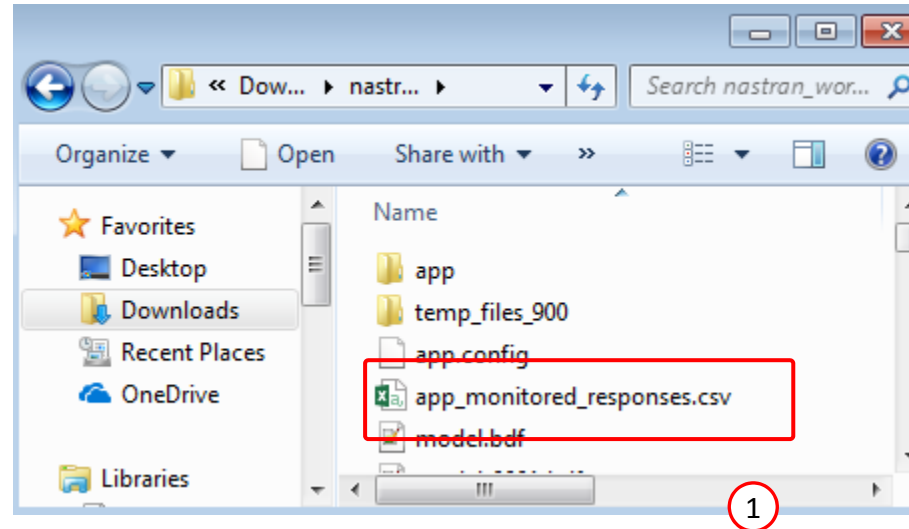

0001	0002	0003	0004	
12.563078819847316	23.62907115939849	37.8338533140817	20.60335328534742	26.6

- A. The table titled Monitored Response can be interacted with. Each column in the table contains filters. Once a filter is modified, the Bar Chart will instantly update.
- B. Additional functions include the ability to highlight the MAX and MIN bars, download a CSV file and reset the filters.

Review Results

1. The monitored responses are contained in the CSV file named `app_monitored_responses.csv`

The responses in this CSV file will be used to train the surrogate model.

A screenshot of an Excel spreadsheet titled 'app_monitored_responses.csv - Excel'. The spreadsheet shows a table with columns A through J. Column A is labeled 'Sample' and contains values 1 through 6. Columns B through J contain numerical data. The table is highlighted with a red border.

	A	B	C	D	E	F	G	H	I	J

Variance

1. Navigate to the section titled Variance
2. Note the normalized root mean square error (NRMSE)
 - NRMSE values are only calculated if `x_testing` and `y_testing` are provided
 - NRMSE values less than .15 indicate the surrogate model has good prediction performance

- **x_training, y_training** - This specifies the x inputs and y outputs used to train the surrogate model.
- **x_testing, y_testing** - This specifies the x inputs and y outputs used to calculate the Normalized Root Mean Square Error (NRMSE) between the predicted values and actual MSC Nastran responses. This testing data is option.
- **x_prediction** – The x inputs at which to make predictions.

Variance 1

Matern52 2

NRMSE: 8.863379504119915e-06

Exponential

NRMSE: 0.019861846267229557

RBF

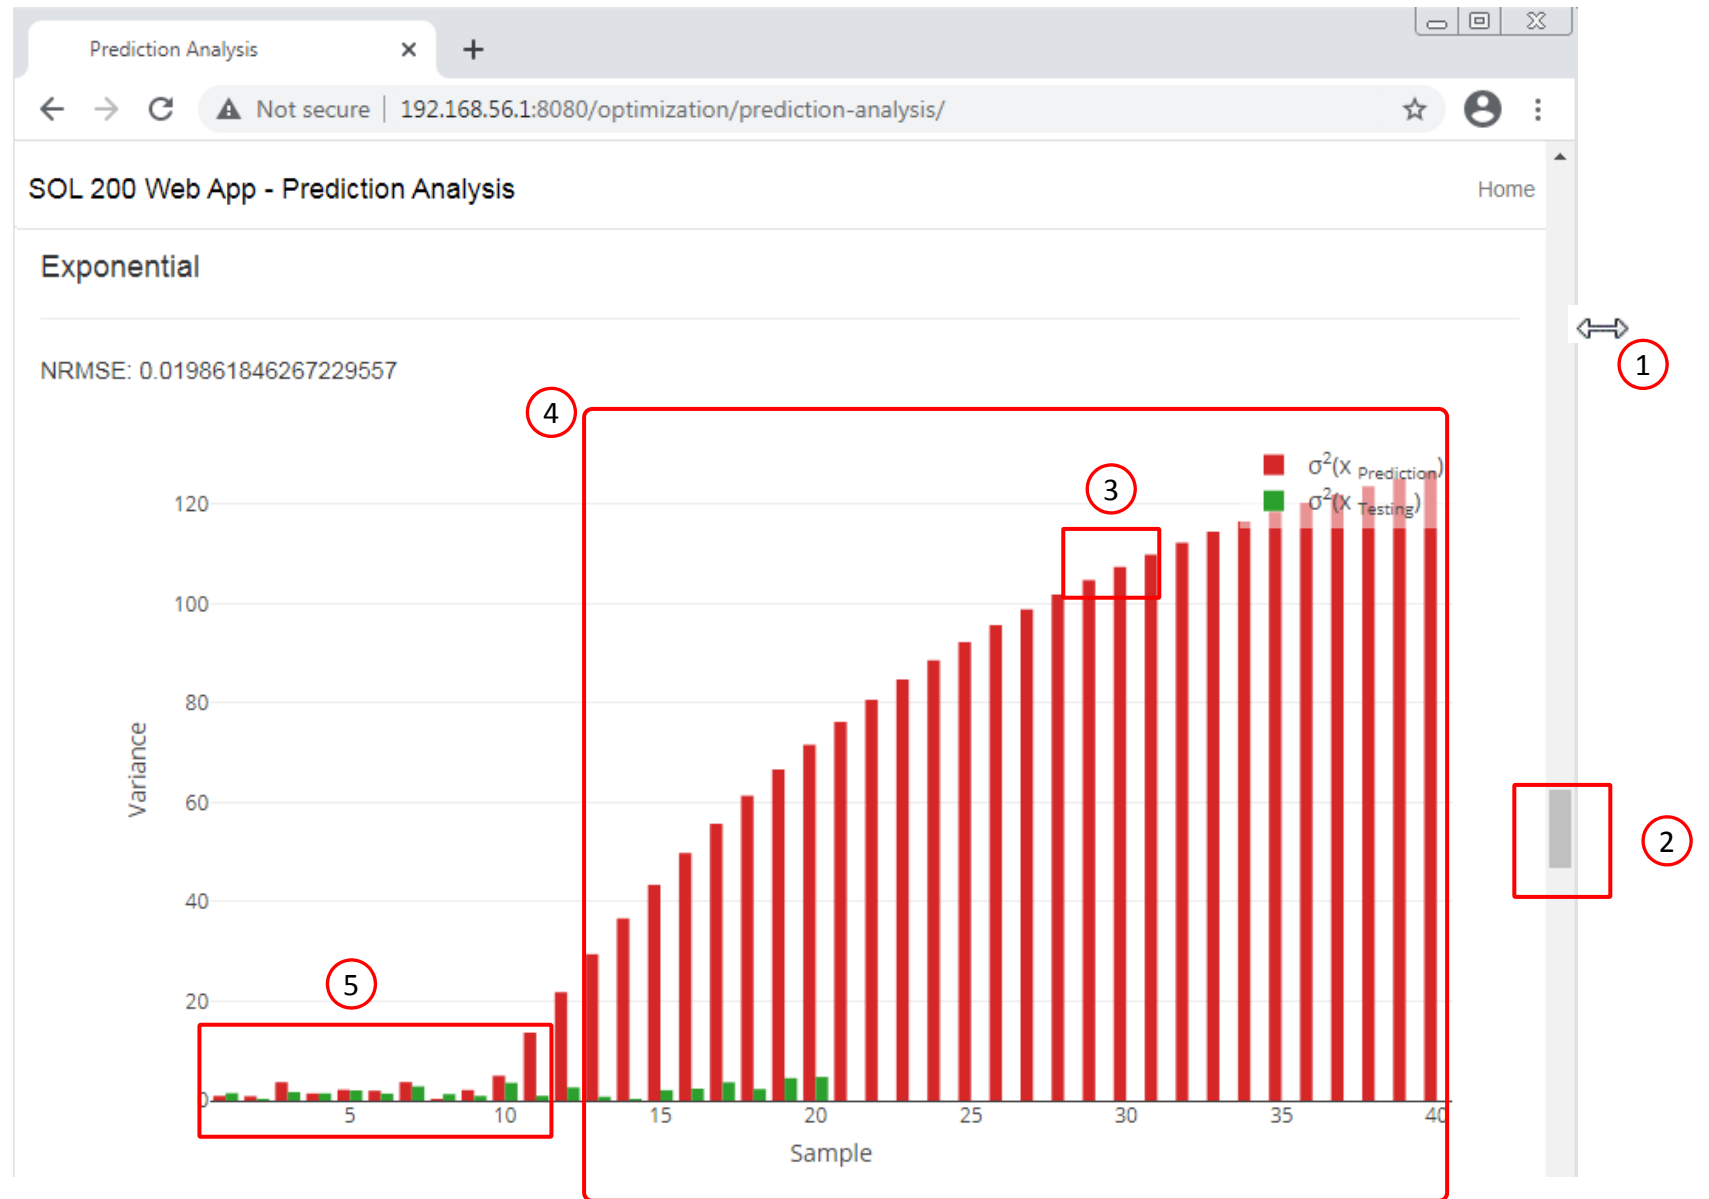

NRMSE: 1.2399877479780946e-05

Variance

1. Resize the window to fit half the screen, this causes the plot to be increased in size
2. Adjust the scroll bar to make the plot visible
3. A high bar indicates a high prediction uncertainty, or a high variance, and is indication that we do not have enough information to conclude the prediction is credible at that prediction point.
4. Note the variance (prediction uncertainty) is high for many of the prediction points (red bars). The x inputs of the original training data was within the bounds of .01 and 10.0, so the surrogate model is valid within these bounds. The prediction points are within the bounds of 1.0 and 40.0 Predictions made outside of these bounds result in high variance (high prediction uncertainty).
5. The first 10 samples of the prediction points are within the bounds of the original training data. The variance values are relatively low.

- In this tutorial, variance (σ^2) is used to gauge the prediction uncertainty. Sometimes, you will see this prediction uncertainty expressed as the standard deviation (σ).

Response Surface

If the problem statement has 1 or 2 parameters configured, a response surface is created. For 3 or more parameters, a response surface is NOT created.

1. Navigate to the section titled Response Surface
2. Deselect the following legend entry:
 - $\mu(x_{\text{Prediction}})$
3. The plot is updated
 - $y(x_{\text{Training}})$: MSC Nastran responses used to train the surrogate model
 - $y(x_{\text{Testing}})$: MSC Nastran responses used to compute the NRMSE
 - $\mu(x_{\text{Prediction}})$: The predicted values at points $x_{\text{prediction}}$
 - $\mu(x)$: The predicted function

Response Surface

Matern52

Response Surface

1. Deselect the following legend entries
 - $y(x_{\text{Training}})$
 - $y(x_{\text{Testing}})$
2. Select the following legend
 - $\mu(x_{\text{Prediction}})$
3. Move the mouse cursor to the right most number label of the horizontal axis, single click the number, type in a value of 20.0, and press Enter. This will cause the horizontal axis to be scaled to be within 0 and 20.0.
4. The plot is updated

The training data used to train the surrogate model was within .1 and 10.0. Predictions should be made within these bounds. Predictions outside the bounds should NOT be performed.

Response Surface

The training data used to train the surrogate model was within .1 and 10.0. Predictions should be made within these bounds. Predictions outside the bounds should NOT be performed.

1. The variance (prediction uncertainty) plot shows that the prediction uncertainty increases as you travel away from the bounds
2. To summarize
 - OK – Predictions are made within the bounds.
 - OK – Predictions are made close to the bounds. In some cases, the surrogate model has good prediction performance for points nearby the bounds.
 - NOT OK – Predictions are made far outside the bounds.

Creating Plots with the HDF5 Explorer

Start Desktop App

1. Open this folder:
nastran_working_directory
2. Inside of the new folder, double click on
Start Desktop App
3. Click Open, Run or Allow Access on any
subsequent windows

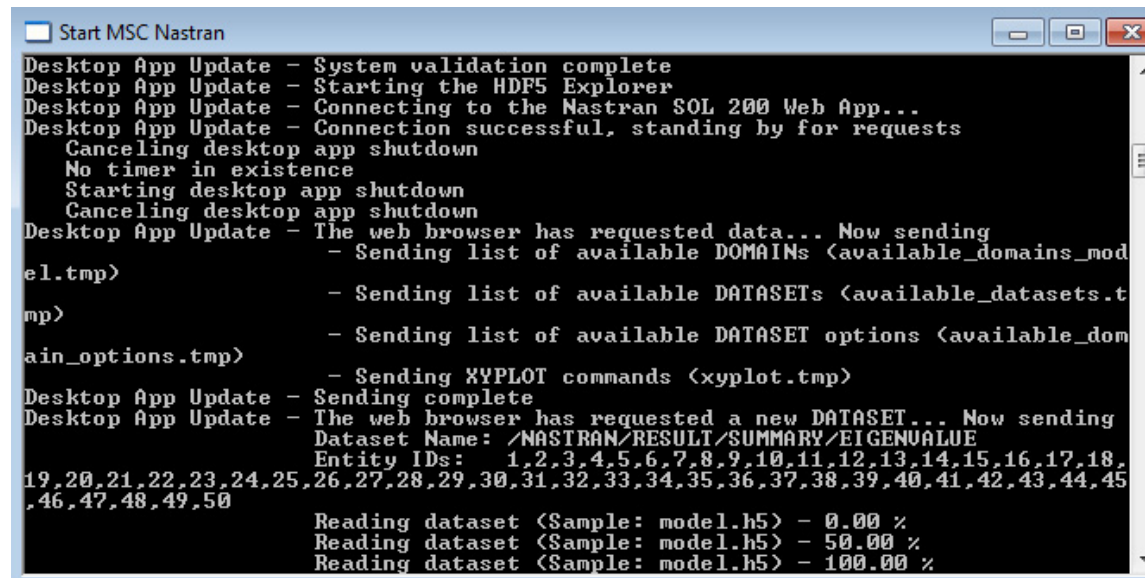

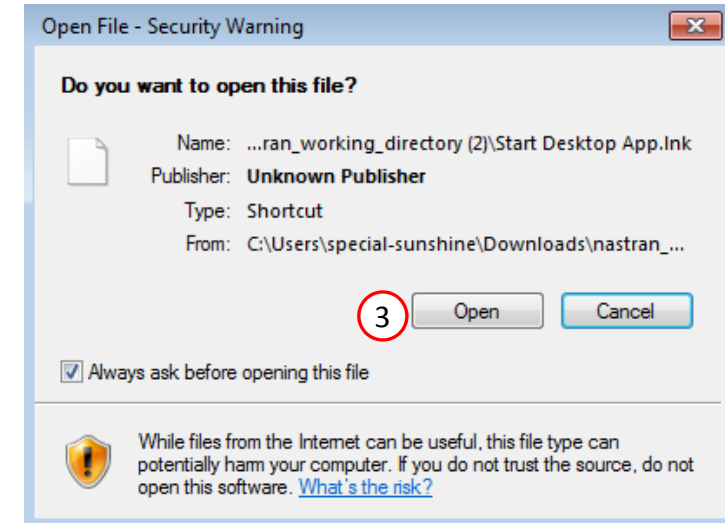

Using Linux?

Follow these instructions:

- 1) Open Terminal
- 2) Navigate to the nastran_working_directory
`cd ./nastran_working_directory`
- 3) Use this command to start the process
`./Start_MSC_Nastran.sh`

In some instances, execute permission must be granted to the directory. Use this command. This command assumes you are one folder level up.

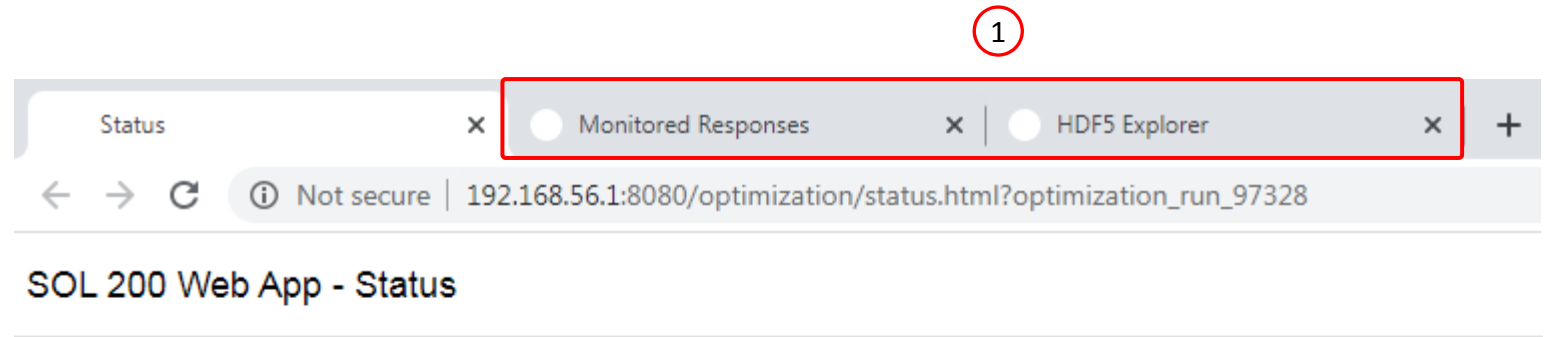

```
sudo chmod -R u+x ./nastran_working_directory
```

Results

Multiple web apps are automatically opened to display the results.

1. Use the tabs to switch between each web app
2. A description of each web app is given in the table.

2

Name of Web App	Purpose	Description
Monitored Responses	<ul style="list-style-type: none">The response value from each sample can be compared.	<ul style="list-style-type: none">After each MSC Nastran analysis, the response values are extracted from the H5 file and contained in a file named app_monitored_responses.csv. The Monitored Responses web app is used to create a bar chart of the values contained in this CSV file.
HDF5 Explorer	<ul style="list-style-type: none">This web app is used to probe each H5 file and generate XY plots.	

Review Results

After MSC Nastran is finished, the results will be automatically uploaded.

1. On this page, the Monitored Responses web app is opened.
2. The value of each response and for each sample is displayed in a bar chart
3. A table lists the values for each response and sample.

A. Additional functions include the ability to highlight the MAX and MIN bars, download a CSV file and reset the filters.

How to import and edit previous files

How to import and edit previous files

The parameters, samples and responses are contained in the following files

- app.config
- BDF files

These files may be imported back to the Parameter Study web app, and any parameters, samples and responses can be reconfigured

Import

1. Return to the window or tab that has the Parameter Study web app opened
2. Refresh the web page to start a new session

- Refreshing the page is only required when the *Select files* button is disabled.

Import

1. Click Select Files
2. Navigate to the folder named nastran_working_directory
3. Select all the BDF files AND the app.config file.
4. Click Open
5. Click Upload files

- All imports require the app.config file to be selected.

Select BDF Files

1. Select files 2 files selected

Inspecting: 100%

What is Gaussian Process Regression?

Gaussian Process Regression Overview

* Hyperparameter optimization is part of the procedure but not covered in this presentation

** $\mu(x)$: This function corresponds to the mean function or kriging model. This function is the prediction model, also known as the surrogate model, meta model or emulator.

Multivariate Normal (MVN) Conditioning Equations

The following must be calculated: Covariance Matrix, Mean and Variance

Covariance Matrix

$$\Sigma = \begin{pmatrix} \Sigma(\chi, \chi) & \Sigma(\chi, X_n) \\ \Sigma(X_n, \chi) & \Sigma_n = \Sigma(X_n, X_n) \end{pmatrix}$$

X_n : Training locations
 χ : Testing (predictive) locations

Apply the covariance function $\Sigma(x, x')$ (kernel $k(x, x')$)

- $\Sigma(\chi, \chi)$: Covariance between testing (predictive) locations and themselves
- $\Sigma(\chi, X_n)$: Covariance between testing (predictive) and training locations
- $\Sigma(X_n, \chi)$: Covariance between training and testing (predictive) locations, which is the transpose of $\Sigma(\chi, X_n)$
- $\Sigma_n = \Sigma(X_n, X_n)$: Covariance between training locations and themselves

MVN Conditioning Equations (Mean and Variance)

Also referred to as “Gaussian process regression,” “kriging” or “kriging equations”

mean $\mu(\chi) = \Sigma(\chi, X_n) \Sigma_n^{-1} Y_n$ Prediction Model (Vary χ to make predictions)

and variance $\Sigma(\chi) = \Sigma(\chi, \chi) - \Sigma(\chi, X_n) \Sigma_n^{-1} \Sigma(X_n, \chi)^T$ Prediction Uncertainty

Example 1

Example 1

Suppose a black box function was executed at 4 different samples (x1, x2 combinations)

With limited data (x and y), what does the response surface look like?

Training Data

Sample	x1	x2	y
1	-1.03	1.76	-1.56E-02
2	.49	.49	3.04E-01
3	1.77	-1.77	3.38E-03
4	3.62	3.76	5.43E-12

Training Data and Testing (Predictive) Locations

Suppose you have the following training data (X_n and Y_n) and testing locations (χ)

- X_n : The training design consists of 4 points
- χ : The test design (locations to make predictions) consists of 2 points

$$X = \begin{bmatrix} \chi \\ X_n \end{bmatrix} = \begin{bmatrix} .35 & .69 \\ .65 & .46 \\ -1.03 & 1.76 \\ .49 & .49 \\ 1.77 & -1.77 \\ 3.62 & 3.76 \end{bmatrix}$$

$$\begin{bmatrix} y^* \\ Y_n \end{bmatrix} = \begin{bmatrix} ? \\ ? \\ -1.56e-02 \\ 3.04e-01 \\ 3.38e-03 \\ 5.43e-12 \end{bmatrix}$$

The goal is make predictions (y^*) for points in χ

Note

- X_n : inputs of the training data
- Y_n : outputs of the training data
- χ or x : inputs of the testing data (predictive locations, i.e. points to make predictions)
- y^* : predicted outputs
- D_n : Training data X_n and Y_n

X : upper case of Greek letter chi (pronounced kai in English)
 χ : lower case of Greek letter chi

Calculation of the Covariance Matrix

1. Select a covariance (kernel) function

- Many covariance functions (kernels) exist: Radial Basis Function (RBF), Matern 5/2, 3/2, Exponential, ...
- For this example, a form of the RBF covariance function is used. This covariance function is described as the “inverse exponentiated squared Euclidean distance”

$$k(x, x') = \Sigma(x, x') = \exp\{-\|x - x'\|^2\} = e^{-\|x - x'\|^2}$$

2. Calculate D (Distance Matrix)

$$D = \|X - X\|^2 \quad \text{“Norm between } X \text{ and } X, \text{ squared”}$$

3. Calculate Σ (Covariance Matrix)

$$\Sigma = e^{-D}$$

Calculation of D

$D =$

$\sqrt{(.35 - .35)^2 + (.69 - .69)^2}$ = 0	$\sqrt{(.35 - .65)^2 + (.69 - .46)^2}$ = .1429	$\sqrt{(.35 - -1.03)^2 + (.69 - 1.76)^2}$ = 3.0493	$\sqrt{(.35 - .49)^2 + (.69 - .49)^2}$ = .0596	$\sqrt{(.35 - 1.77)^2 + (.69 - -1.77)^2}$ = 8.068	$\sqrt{(.35 - 3.62)^2 + (.69 - 3.76)^2}$ = 20.1178
.1429	$\sqrt{(.65 - .65)^2 + (.46 - .46)^2}$ = 0	$\sqrt{(.65 - -1.03)^2 + (.46 - 1.76)^2}$ = 4.5124	$\sqrt{(.65 - .49)^2 + (.46 - .49)^2}$ = .0265	$\sqrt{(.65 - 1.77)^2 + (.46 - -1.77)^2}$ = 6.2273	$\sqrt{(.65 - 3.62)^2 + (.46 - 3.76)^2}$ = 19.7109
3.0493	4.5124	$\sqrt{(-1.03 - -1.03)^2 + (1.76 - 1.76)^2}$ = 0	$\sqrt{(-1.03 - .49)^2 + (1.76 - .49)^2}$ = 3.9233	$\sqrt{(-1.03 - 1.77)^2 + (1.76 - -1.77)^2}$ = 20.3009	$\sqrt{(-1.03 - 3.62)^2 + (1.76 - 3.76)^2}$ = 25.6225
.0596	.0265	3.9233	$\sqrt{(.49 - .49)^2 + (.49 - .49)^2}$ = 0	$\sqrt{(.49 - 1.77)^2 + (.49 - -1.77)^2}$ = 6.746	$\sqrt{(.49 - 3.62)^2 + (.49 - 3.76)^2}$ = 20.4898
8.068	6.2273	20.3009	6.746	$\sqrt{(1.77 - 1.77)^2 + (-1.77 - -1.77)^2}$ = 0	$\sqrt{(1.77 - 3.62)^2 + (-1.77 - 3.76)^2}$ = 34.0034
20.1178	19.7109	25.6225	20.4898	34.0034	$\sqrt{(3.62 - 3.62)^2 + (3.76 - 3.76)^2}$ = 0

Calculation of Σ

$$\Sigma = \begin{bmatrix} e^0 = 1 & e^{-.1429} = .8668 & e^{-3.0493} = .0474 & e^{-.0596} = .9421 & e^{-8.068} = .0003 & e^{-20.1178} = 1.832e-9 \\ .8668 & e^0 = 1 & e^{-4.5124} = .0110 & e^{-.0265} = .9738 & e^{-6.2273} = .0020 & e^{-19.7109} = 2.8e-9 \\ .0474 & .0110 & e^0 = 1 & e^{-3.9233} = .0198 & e^{-20.3009} = 1.5e-9 & e^{-25.6225} = 7.5e-12 \\ .9421 & .9738 & .0198 & e^0 = 1 & e^{-6.746} = .0012 & e^{-20.4898} = 1.263e-9 \\ .0003 & .0020 & 1.5e-9 & .0012 & e^0 = 1 & e^{-34.0034} = 1.7e-15 \\ 1.832e-9 & 2.8e-9 & 7.5e-12 & 1.263e-9 & 1.7e-15 & e^0 = 1 \end{bmatrix}$$

Calculation of Σ

$$\Sigma = \begin{bmatrix} \Sigma(\chi, \chi) & \Sigma(\chi, X_n) \\ \Sigma(X_n, \chi) & \Sigma_n = \Sigma(X_n, X_n) \end{bmatrix}$$

The matrix Σ is composed of four sub-matrices, each representing a covariance matrix for a set of variables. The sub-matrices are arranged in a 2x2 block structure, with the top-left block representing the covariance matrix for the variables χ and the bottom-right block representing the covariance matrix for the variables X_n . The off-diagonal blocks represent the cross-covariance matrices between χ and X_n .

The sub-matrices are defined as follows:

- $\Sigma(\chi, \chi)$: Covariance matrix for χ . The diagonal elements are $e^0 = 1$ and $e^0 = 1$. The off-diagonal element is $e^{-1.429} = .8668$.
- $\Sigma(\chi, X_n)$: Cross-covariance matrix between χ and X_n . The diagonal elements are $e^{-3.0493} = .0474$ and $e^{-4.5124} = .0110$. The off-diagonal elements are $e^{-.0596} = .9421$ and $e^{-.0265} = .9738$.
- $\Sigma(X_n, \chi)$: Cross-covariance matrix between X_n and χ . The diagonal elements are $e^{-.0596} = .9421$ and $e^{-.0265} = .9738$. The off-diagonal elements are $e^{-3.0493} = .0474$ and $e^{-4.5124} = .0110$.
- $\Sigma_n = \Sigma(X_n, X_n)$: Covariance matrix for X_n . The diagonal elements are $e^0 = 1$ and $e^0 = 1$. The off-diagonal element is $e^{-6.746} = .0012$.

Since Σ is symmetric, note that $\Sigma(X_n, \chi) = \Sigma(\chi, X_n)^T$

Calculation of Predictive Quantities

The MVN conditioning equations are used to determine the predictive quantities mean and variance

mean $\mu(\mathcal{X}) = \Sigma(\mathcal{X}, X_n) \Sigma_n^{-1} Y_n$

$$\mu(\chi) = y * = \begin{pmatrix} 0.2849657 \\ 0.2954011 \end{pmatrix} \quad \text{Predicted values for locations in } \chi$$

and variance $\Sigma(\mathcal{X}) = \Sigma(\mathcal{X}, \mathcal{X}) - \Sigma(\mathcal{X}, X_n) \Sigma_n^{-1} \Sigma(\mathcal{X}, X_n)^\top$

$$\Sigma(\chi) = \begin{pmatrix} 0.11154162 & -0.05042265 \\ -0.05042265 & 0.05155061 \end{pmatrix} \quad \text{Prediction Uncertainty}$$

The diagonal terms are the variances at prediction points 1 and 2

$$\sigma^2(\chi) = \begin{pmatrix} 0.11154162 \\ 0.05155061 \end{pmatrix}$$

R

Code to replicate this example in R

```
library(plgp)

eps = sqrt(.Machine$double.eps)

# Training points
X = rbind(c(-1.03,1.76), c(.49,.49), c(1.77,-1.77), c(3.62,3.76))

# The goal is to fit this function:  $y(x) = x_1 * \exp(-x_1^2 - x_2^2)$
